Abstract

The main object of this paper is to find the Brauer Trees of the symmetric group S_{21} modulo $P = 13$ which can give the irreducible modular spin characters of S_{21} Modulo $P = 13$

Key words: Modular representations and characters, Brauer trees, decomposition matrix for the spin characters

1. Introduction

The Symmetric group S_n has a representation group \overline{S}_n of order $2(n!)$, then the irreducible representations or characters of \overline{S}_n are of the two distinct types [1, 2].

1. The representation of S_n which is called the ordinary representation. The irreducible representations and characters corresponding to partition λ of n denoted by $(\lambda) = (\lambda_1, \lambda_2, \dots, \lambda_m)$ and $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_m > 0$

2. The representation of S_n which is called the spin representation. The irreducible representations are indexed by partitions λ of distinct parts which are called bar partitions written $\lambda \vdash n$ [2, 3].

In fact, if $(\lambda) = (\lambda_1, \lambda_2, \dots, \lambda_n)$, $\lambda \vdash n$ and if $n - m$ is even, then there is one irreducible spin character denoted by $\langle \lambda \rangle$ which is self-associate and if $n - m$ is odd, then there are two associate spin characters denoted by $\langle \lambda \rangle$ and $\langle \lambda \rangle'$. The degree of these characters $\langle \lambda \rangle$ and $\langle \lambda \rangle'$ is [1,6]

$$2^{\left\lfloor \frac{(n-m)}{2} \right\rfloor} \frac{n!}{\prod_{i=1}^m \lambda_i!} \prod_{1 \leq i < j \leq m} \frac{\lambda_i - \lambda_j}{\lambda_i + \lambda_j}$$

The decomposition matrix gives the relationships between the irreducible spin characters and projective indecomposable spin characters of S_n .

In this paper we determined the irreducible modular spin characters of the symmetric group S_{21} modulo 13 by using the method (r, r') -inducing (restricting) [3] to distribute the spin characters into

p-blocks and use Morris-Humphreys theorem [4]. The Brauer trees for spin characters of S_n , $13 \leq n \leq 20$ modulo $p=13$ are found by Taban and Jawad [5].

2. Preliminaries

The fundamental theorem of the modular spin characters of symmetric groups S_n which distribute the spin irreducible characters into p-block is called Morris-Humphreys Theorem [4] Morris formulated this conjecture on how the irreducible spin characters of \hat{S}_n are assigned into p-blocks [6] and proved by [7]. To formulate this theorem, the following definitions are given:

Definition: (2.1) Let $\lambda \vdash n$ then the shifted young diagram $S(\lambda)$ of λ is the diagram obtained from the young diagram of λ by moving the i th row of λ $(i-1)$ position to the right.

There is a young diagram $\tilde{\lambda}$ with $2n$ nodes, called the shifted-symmetric diagram where

$$\tilde{\lambda} = (\lambda_1, \lambda_2, \dots, \lambda_m ; \lambda_1 - 1, \lambda_2 - 1, \dots, \lambda_m - 1)$$

Example: if $\lambda = (751)$

$$S(\lambda) = \begin{array}{cccccccc} & & X & X & X & X & X & X & X \\ & & & X & X & X & X & X & \\ & & & & & & X & & \end{array}$$

$$\tilde{\lambda} = \begin{array}{cccccccc} & & 0 & X & X & X & X & X & X \\ & & 0 & 0 & X & X & X & X & \\ & & 0 & 0 & 0 & X & & & \\ & & 0 & 0 & & & & & \\ & & 0 & 0 & & & & & \\ & & 0 & 0 & & & & & \\ & & 0 & & & & & & \end{array}$$

Definition: (2.2) The p-bar of $S(\lambda)$ means bars of length P that is either

- (1) Two rows which contain p-nodes or
- (2) One row which contains the last p-nodes such that the resulting diagram gives a bar partition.

Definition: (2.3) A partition is a p-bar core or \bar{p} -core if no p-bar can be removed from it.

Theorem: (Morris-Humphreys Theorem) [4]

Let λ and μ be a bar partition such that $\lambda \neq \mu$ then $\langle \lambda \rangle$ and $\langle \mu \rangle$ are in the same p-block if and only if

$$\lambda(\bar{p}) = \mu(\bar{p}) \quad (\text{where } p \text{ is an odd prime}).$$

The associative irreducible spin characters $\langle \lambda \rangle$ and $\langle \lambda \rangle'$

are in the same p-block if $\lambda(\bar{p}) \neq \lambda$.

Example: Let $\lambda = \langle 621 \rangle, P = 5$

$$\begin{array}{cccccc}
 & 0 & 1 & 2 & 3 & 4 & 0 & 1 \\
 & 4 & 0 & 1 & 2 & & & \\
 (\tilde{\lambda}) = & 3 & 4 & 0 & 1 & & & \\
 & 2 & & & & & & \\
 & 1 & & & & & & \\
 & 0 & & & & & &
 \end{array}$$

$$\langle 621 \rangle \uparrow^{(2,4)} = \langle 721 \rangle + \langle 721 \rangle'$$

$$\langle 621 \rangle \uparrow^{(3,3)} = \langle 631 \rangle + \langle 631 \rangle'$$

Definition: (2.4) Let λ be a bar partition of n then the p-residue of the (i, j) -node of $\tilde{\lambda}$ is the least non negative integer r such that $j - i \equiv r \pmod{p}$, $0 \leq r \leq p - 1$

Let $\bar{r} = p - r + 1$ then $r + \bar{r} \equiv 1 \pmod{p}$, \bar{r} is called the conjugate residue to r .

We now denote by $\langle \lambda \rangle \uparrow^{(r, \bar{r})}$ all the diagrams obtained by adding one node with p-residue r or \bar{r} to the

$S(\lambda)$ component of the diagram $\langle \hat{\lambda} \rangle$. Then for $r = 0, 1, 2, \dots, \frac{p+1}{2}$.

$\langle \hat{\lambda} \rangle \uparrow^{(r, \bar{r})}$ are called the diagrams (r, \bar{r}) -induced from $\langle \lambda \rangle$ conversely the process of deleting nodes with p-residue r or \bar{r} is called (r, \bar{r}) -restriction

Example: Let $\langle \lambda \rangle = \langle 531 \rangle, p = 3$

$$\begin{array}{cccccc}
 & 0 & 1 & 2 & 0 & 1 & 2 & 0 \\
 & 2 & 0 & 1 & 2 & 0 & 1 & \\
 (\tilde{\lambda}) = & 1 & 2 & 0 & 1 & 2 & & \\
 & 0 & 1 & 2 & & & & \\
 & 2 & 0 & & & & & \\
 & 1 & & & & & &
 \end{array}$$

$$\langle \lambda \rangle \uparrow^{(0,1)} = \langle 631 \rangle + \langle 631 \rangle' + \langle 541 \rangle + \langle 541 \rangle'$$

$$\langle \lambda \rangle \uparrow^{(2,2)} = \langle 532 \rangle + \langle 532 \rangle'$$

Now, if $\varphi = \sum d\lambda \langle \lambda \rangle + d\lambda' \langle \lambda' \rangle$ is projective indecomposable spin character of S_n (where $d\lambda' = 0$ if $\langle \lambda \rangle = \langle \lambda' \rangle$) then $\varphi \uparrow S_{n+1}$ is a projective spin character of S_{n+1} which is in general not indecomposable [3].

The following results are very useful to find the modular characters:

1. Every spin (modular, projective) character of S_n can be written as a linear combination with non-negative integer coefficients of the irreducible spin (irreducible modular, projective indecomposable) characters respectively [8]
2. Let H be a subgroup of the group G [9] then :
 - (a) If φ is a modular (principle) character of a subgroup H of G , then $\varphi \uparrow G$ is a modular (principal) character of G (where \uparrow denotes inducing)
 - (b) If ψ is a modular (principal) character of group G , then $\psi \downarrow H$ is a modular (principal) character of a subgroup H . (where \downarrow denotes the restricting)
3. Let G be a group of order $m = m_0 p^a$, where $(p, m_0) = 1$, if c is principal character of H then degree $c \equiv 0 \pmod{p^a}$ [10].
4. If c is a principal character of G for an odd prime p and all entries in c are divisible by positive integer q , then c/q is a principal character of G [9]
5. Let $(\alpha) = (\alpha_1, \alpha_2, \dots, \alpha_m)$ be a bar partition of n not a p -bar core, let B be the block containing $\langle \alpha \rangle$ then
 - (a) If $n - m - m_0$ is even then all irreducible modular spin characters in B are double
 - (b) If $n - m - m_0$ is odd then all irreducible modular spin characters in B are associate (where m_0 the number of parts of α divisible by p). [11]

Notation

i.m.s. : irreducible modular spin characters

m.s. : modular spin characters

p.i.s. : Principal indecomposable spin character

p.s. : principal spin character

The Brauer tree of the symmetric group \overline{S}_n , $p=13$. The group S_{21} has 114 irreducible spin characters and S_{21} has 105 of $(13, \alpha)$ – regular classes then the decomposition matrix of the spin character of S_{21} , $p=13$ has 114 rows and 105 columns. [4]

There are fifty seven 13-block, (Morris and Humphreys theorem) $B_1, B_2, B_3, B_4, B_5, B_6$, 6 of their blocks of defect 1.

All the 51 remaining characters form their own blocks $B_7, B_8, B_9, \dots, B_{57}$ of defect 0 [9] which are irreducible modular spin characters.

The principal block B_1 (the block which contains the spin character $\langle n \rangle$ or $\langle n \rangle'$ where B_1 contains the irreducible spin characters

$\{ \langle 21 \rangle^*, \langle 13, 8 \rangle, \langle 13, 8 \rangle', \langle 12, 8, 1 \rangle^*, \langle 11, 8, 2 \rangle^*, \langle 9, 8, 4 \rangle^*, \langle 8, 7, 6 \rangle^*, \langle 10, 8, 3 \rangle^* \}$ has 13 – bar core $\langle 8 \rangle$

B_2 Contains the irreducible spin characters

$$\left\{ \begin{aligned} &\langle 20,1 \rangle, \langle 20,1 \rangle', \langle 14,7 \rangle, \langle 14,7 \rangle', \langle 13,7,1 \rangle^*, \langle 11,7,2,1 \rangle, \langle 11,7,2,1 \rangle', \\ &\langle 10,7,3,1 \rangle, \langle 10,7,3,1 \rangle', \langle 9,7,4,1 \rangle, \langle 9,7,4,1 \rangle', \langle 8,7,5,1 \rangle, \langle 8,7,5,1 \rangle' \end{aligned} \right\}$$

Has 13-bar core $\langle 7,1 \rangle$

B_3 Contains the irreducible spin characters

$$\left\{ \begin{aligned} &\langle 19,2 \rangle, \langle 19,2 \rangle', \langle 15,6 \rangle, \langle 15,6 \rangle', \langle 13,6,2 \rangle^*, \langle 12,6,2,1 \rangle, \langle 12,6,2,1 \rangle', \\ &\langle 10,6,3,2 \rangle, \langle 10,6,3,2 \rangle', \langle 9,6,4,2 \rangle, \langle 9,6,4,2 \rangle', \langle 8,6,5,2 \rangle, \langle 8,6,5,2 \rangle' \end{aligned} \right\}$$

Has 13-bar core $\langle 6,2 \rangle$

B_4 Contains the irreducible spin characters

$$\left\{ \begin{aligned} &\langle 18,3 \rangle, \langle 18,3 \rangle', \langle 16,5 \rangle, \langle 16,5 \rangle', \langle 13,5,3 \rangle^*, \langle 12,5,3,1 \rangle, \langle 12,5,3,1 \rangle', \langle 11,5,3,2 \rangle, \\ &\langle 11,5,3,2 \rangle', \langle 9,5,4,3 \rangle, \langle 9,5,4,3 \rangle', \langle 7,6,5,3 \rangle, \langle 7,6,5,3 \rangle' \end{aligned} \right\}$$

Has 13-bar core $\langle 5,3 \rangle$

B_5 Contains the irreducible spin characters

$$\left\{ \langle 18,2,1 \rangle^*, \langle 15,5,1 \rangle^*, \langle 14,5,2 \rangle^*, \langle 13,5,2,1 \rangle, \langle 13,5,2,1 \rangle', \langle 10,5,3,2,1 \rangle^*, \langle 9,5,4,2,1 \rangle^*, \langle 7,6,5,2,1 \rangle^*, \right\}$$

Has 13-bar core $\langle 5,2,1 \rangle$

B_6 Contains the irreducible spin characters

$$\left\{ \langle 17,3,1 \rangle^*, \langle 16,4,1 \rangle^*, \langle 14,4,3 \rangle^*, \langle 13,4,3,1 \rangle, \langle 13,4,3,1 \rangle', \langle 11,4,3,2,1 \rangle^*, \langle 8,5,4,3,1 \rangle^*, \langle 7,6,4,3,1 \rangle^* \right\}$$

Has 13-bar core $\langle 4,3,1 \rangle$

Lemma (3.1)

The Brauer tree for Principal block B_1 is:

$$\langle 21 \rangle^* - \langle 13,8 \rangle = \langle 13,8 \rangle' - \langle 12,8,1 \rangle^* - \langle 11,8,2 \rangle^* - \langle 10,8,3 \rangle^* - \langle 9,8,4 \rangle^* - \langle 8,7,6 \rangle^*$$

Proof :

$$\deg \{ \langle 21 \rangle^*, \langle 12,8,1 \rangle^*, \langle 10,8,3 \rangle^*, \langle 8,7,6 \rangle^* \} \equiv 10 \pmod{13};$$

$$\deg \{ (\langle 13,8 \rangle + \langle 13,8 \rangle'), \langle 11,8,2 \rangle^*, \langle 9,8,4 \rangle^* \} \equiv -10 \pmod{13}.$$

By using (r, \bar{r}) -inducing for p.i.s of S_{20} see (appendix I) to S_{21} we have

$$J_{31} \uparrow^{(8,6)} S_{21} = \langle 20 \rangle + \langle 13,7 \rangle^* \uparrow^{(8,6)} S_{21} = \langle 21 \rangle^* + \langle 13,8 \rangle + \langle 13,8 \rangle' = d_1$$

$$J_{33} \uparrow^{(8,6)} S_{21} = \langle 13,7 \rangle^* + \langle 12,7,1 \rangle \uparrow^{(8,6)} S_{21} = \langle 13,8 \rangle + \langle 13,8 \rangle' + \langle 12,8,1 \rangle^* = d_2$$

$$J_{35} \uparrow^{(8,6)} S_{21} = \langle 12,7,1 \rangle + \langle 11,7,2 \rangle \uparrow^{(8,6)} S_{21} = \langle 12,8,1 \rangle^* + \langle 11,8,2 \rangle^* = d_3$$

$$J_{37} \uparrow^{(8,6)} S_{21} = \langle 11,7,2 \rangle + \langle 10,7,3 \rangle \uparrow^{(8,6)} S_{21} = \langle 11,8,2 \rangle^* + \langle 10,8,3 \rangle^* = d_4$$

$$J_{39} \uparrow^{(8,6)} S_{21} = \langle 10,7,3 \rangle + \langle 9,7,4 \rangle \uparrow^{(8,6)} S_{21} = \langle 10,8,3 \rangle^* + \langle 9,8,4 \rangle^* = d_5$$

$$J_{41} \uparrow^{(8,6)} S_{21} = \langle 9,7,4 \rangle + \langle 8,7,5 \rangle \uparrow^{(8,6)} S_{21} = \langle 9,8,4 \rangle^* + \langle 8,7,6 \rangle^* = d_6$$

So we have the Brauer tree for B_1 and the decomposition matrix of this block $D_{21,13}^{(1)}$ in Table (1) “

Lemma (3.2)

The Brauer tree for the block B_2 is:

$$\begin{array}{ccc}
 \langle 20,1 \rangle - \langle 14,7 \rangle & & \langle 11,7,2,1 \rangle - \langle 10,7,3,1 \rangle - \langle 9,7,4,1 \rangle - \langle 8,7,5,1 \rangle \\
 & \backslash \quad / & \\
 & \langle 13,7,1 \rangle^* & \\
 & / \quad \backslash & \\
 \langle 20,1 \rangle' - \langle 14,7 \rangle' & & \langle 11,7,2,1 \rangle' - \langle 10,7,3,1 \rangle' - \langle 9,7,4,1 \rangle' - \langle 8,7,5,1 \rangle'
 \end{array}$$

Proof :

$$\deg \{ \langle 14,7 \rangle, \langle 14,7 \rangle', \langle 11,7,2,1 \rangle, \langle 11,7,2,1 \rangle', \langle 9,7,4,1 \rangle, \langle 9,7,4,1 \rangle' \} \equiv -4 \pmod{13}$$

$$\deg \{ \langle 20,1 \rangle, \langle 20,1 \rangle', \langle 13,7,1 \rangle^*, \langle 10,7,3,1 \rangle, \langle 10,7,3,1 \rangle', \langle 8,7,5,1 \rangle, \langle 8,7,5,1 \rangle' \} \equiv 4 \pmod{13}$$

By using (r, \bar{r}) -inducing for p.i.s of S_{20} see (appendix I) to S_{21} we have

$$J_{13} \uparrow^{(7,7)} S_{21} = \langle 19,1 \rangle^* + \langle 14,6 \rangle^* \uparrow^{(7,7)} S_{21} = \langle 20,1 \rangle + \langle 20,1 \rangle' + \langle 14,7 \rangle + \langle 14,7 \rangle' = k_1$$

$$J_{31} \uparrow^{(1,0)} S_{21} = \langle 20 \rangle + \langle 13,7 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 20,1 \rangle + \langle 14,7 \rangle + \langle 14,7 \rangle' + \langle 13,7,1 \rangle^* = k_2$$

$$J_{32} \uparrow^{(1,0)} S_{21} = \langle 20 \rangle' + \langle 13,7 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 20,1 \rangle' + \langle 14,7 \rangle + \langle 14,7 \rangle' + \langle 13,7,1 \rangle^* = k_3$$

$$J_{35} \uparrow^{(1,0)} S_{21} = \langle 12,7,1 \rangle + \langle 11,7,2 \rangle \uparrow^{(1,0)} S_{21} = \langle 13,7,1 \rangle^* + \langle 11,7,2,1 \rangle = d_{11}$$

$$J_{36} \uparrow^{(1,0)} S_{21} = \langle 12,7,1 \rangle' + \langle 11,7,2 \rangle' \uparrow^{(1,0)} S_{21} = \langle 13,7,1 \rangle^* + \langle 11,7,2,1 \rangle' = d_{12}$$

$$J_{37} \uparrow^{(1,0)} S_{21} = \langle 11,7,2 \rangle + \langle 10,7,3 \rangle \uparrow^{(1,0)} S_{21} = \langle 11,7,2,1 \rangle + \langle 10,7,3,1 \rangle = d_{13}$$

$$J_{38} \uparrow^{(1,0)} S_{21} = \langle 11,7,2 \rangle' + \langle 10,7,3 \rangle' \uparrow^{(1,0)} S_{21} = \langle 11,7,2,1 \rangle' + \langle 10,7,3,1 \rangle' = d_{14}$$

$$J_{39} \uparrow^{(1,0)} S_{21} = \langle 10,7,3 \rangle + \langle 9,7,4 \rangle \uparrow^{(1,0)} S_{21} = \langle 10,7,3,1 \rangle + \langle 9,7,4,1 \rangle = d_{15}$$

$$J_{40} \uparrow^{(1,0)} S_{21} = \langle 10,7,3 \rangle' + \langle 9,7,4 \rangle' \uparrow^{(1,0)} S_{21} = \langle 10,7,3,1 \rangle' + \langle 9,7,4,1 \rangle' = d_{16}$$

$$J_{41} \uparrow^{(1,0)} S_{21} = \langle 9,7,4 \rangle + \langle 8,7,5 \rangle \uparrow^{(1,0)} S_{21} = \langle 9,7,4,1 \rangle + \langle 8,7,5,1 \rangle = d_{17}$$

$$J_{42} \uparrow^{(1,0)} S_{21} = \langle 9,7,4 \rangle' + \langle 8,7,5 \rangle' \uparrow^{(1,0)} S_{21} = \langle 9,7,4,1 \rangle' + \langle 8,7,5,1 \rangle' = d_{18}$$

$$\langle 14,7,1 \rangle \downarrow_{S_{21}}^{(1,0)} = \langle 13,7,1 \rangle^* + \langle 14,7 \rangle = d_9 \text{ Since } \langle 14,7,1 \rangle \text{ i.m in } S_{22}$$

$$\langle 14,7,1 \rangle' \downarrow_{S_{21}}^{(1,0)} = \langle 13,7,1 \rangle^* + \langle 14,7 \rangle' = d_{10} \text{ Since } \langle 14,7,1 \rangle' \text{ i.m in } S_{22}$$

But $k_1 = k_2 + k_3 - d_9 - d_{10}$ then $k_2 - d_{10} = d_7$, $k_3 - d_9 = d_8$

So we have the Brauer tree for B_2 [12] and the decomposition matrix for this block $D_{21,13}^{(2)}$ in Table (2)

Lemma (3.3)

The Brauer tree for the block B_3 is:

Proof :

$$\deg \{ \langle 19,2 \rangle, \langle 19,2 \rangle', \langle 13,6,2 \rangle^*, \langle 10,6,3,2 \rangle, \langle 10,6,3,2 \rangle', \langle 8,6,5,2 \rangle, \langle 8,6,5,2 \rangle' \} \equiv -8 \pmod{13}$$

$$\deg \{ \langle 15,6 \rangle, \langle 15,6 \rangle', \langle 12,6,2,1 \rangle, \langle 12,6,2,1 \rangle', \langle 9,6,4,2 \rangle, \langle 9,6,4,2 \rangle' \} \equiv 8 \pmod{13}$$

Now, by using (r, \bar{r}) -inducing of p.i.s of S_{20} to S_{21} see (appendix I) $D_{20,13}$ we have

$$\begin{aligned}
 J_{13} \uparrow^{(2,12)} S_{21} &= \langle 19,1 \rangle^* + \langle 14,6 \rangle^* \uparrow^{(2,12)} S_{21} = \langle 19,2 \rangle + \langle 19,2 \rangle' + \langle 15,6 \rangle + \langle 15,6 \rangle' = k_1 = d_{19} + d_{20} \\
 J_{14} \uparrow^{(2,12)} S_{21} &= \langle 14,6 \rangle^* + \langle 13,6,1 \rangle + \langle 13,6,1 \rangle' \uparrow^{(2,12)} S_{21} = \langle 15,6 \rangle + \langle 15,6 \rangle' + 2\langle 13,6,2 \rangle^* = k_2 = d_{21} + d_{22} \\
 J_{15} \uparrow^{(2,12)} S_{21} &= \langle 13,6,1 \rangle + \langle 13,6,1 \rangle' + \langle 11,6,2,1 \rangle^* \uparrow^{(2,12)} S_{21} = 2\langle 13,6,2 \rangle^* + \langle 12,6,2,1 \rangle + \langle 12,6,2,1 \rangle' = k_3 = d_{23} + d_{24} \\
 J_{16} \uparrow^{(2,12)} S_{21} &= \langle 11,6,2,1 \rangle^* + \langle 10,6,3,1 \rangle^* \uparrow^{(2,12)} S_{21} = \langle 12,6,2,1 \rangle + \langle 12,6,2,1 \rangle' + \langle 10,6,3,2 \rangle + \langle 10,6,3,2 \rangle' = k_4 = d_{25} + d_{26} \\
 J_{17} \uparrow^{(2,12)} S_{21} &= \langle 10,6,3,1 \rangle^* + \langle 9,6,4,1 \rangle^* \uparrow^{(2,12)} S_{21} = \langle 10,6,3,2 \rangle + \langle 10,6,3,2 \rangle' + \langle 9,6,4,2 \rangle + \langle 9,6,4,2 \rangle' = k_5 = d_{27} + d_{28} \\
 J_{18} \uparrow^{(2,12)} S_{21} &= \langle 9,6,4,1 \rangle^* + \langle 8,6,5,1 \rangle^* \uparrow^{(2,12)} S_{21} = \langle 9,6,4,2 \rangle + \langle 9,6,4,2 \rangle' + \langle 8,6,5,2 \rangle + \langle 8,6,5,2 \rangle' = k_6 = d_{29} + d_{30}
 \end{aligned}$$

Since $\langle 19,2 \rangle \neq \langle 19,2 \rangle', \langle 15,6 \rangle \neq \langle 15,6 \rangle', \langle 12,6,2,1 \rangle \neq \langle 12,6,2,1 \rangle', \langle 10,6,3,2 \rangle \neq \langle 10,6,3,2 \rangle', \langle 9,6,4,2 \rangle \neq \langle 9,6,4,2 \rangle'$ and $\langle 8,6,5,2 \rangle \neq \langle 8,6,5,2 \rangle'$

On $(13, \alpha)$ regular classes then $k_1, k_2, k_3, k_4, k_5,$ and k_6 are splits (respectively) so we have the Brauer tree for B_3 and the decomposition matrix for this block $D_{21,13}^{(3)}$ in Table (3)

Lemma (3.4)

The Brauer tree for the block B_4 is:

Proof :

$$\deg \{ \langle 18,3 \rangle, \langle 18,3 \rangle', \langle 13,5,3 \rangle^*, \langle 11,5,3,2 \rangle, \langle 11,5,3,2 \rangle', \langle 7,6,5,3 \rangle, \langle 7,6,5,3 \rangle' \} \equiv -8 \pmod{13}$$

$$\deg \{ \langle 16,5 \rangle, \langle 16,5 \rangle', \langle 12,5,3,1 \rangle, \langle 12,5,3,1 \rangle', \langle 9,5,4,3 \rangle, \langle 9,5,4,3 \rangle' \} \equiv 8 \pmod{13}$$

Now, by (r, \bar{r}) -inducing of p.i.s of S_{20} to S_{21} see (appendix I) $D_{20,3}$ we have

$$J_{19} \uparrow^{(3,11)} S_{21} = \langle 18,2 \rangle^* + \langle 15,5 \rangle^* \uparrow^{(3,11)} S_{21} = \langle 18,3 \rangle + \langle 18,3 \rangle' + \langle 16,5 \rangle + \langle 16,5 \rangle' = k_1 = d_{31} + d_{32}$$

$$J_{20} \uparrow^{(3,11)} S_{21} = \langle 15,5 \rangle^* + \langle 13,5,2 \rangle + \langle 13,5,2 \rangle' + \uparrow^{(3,11)} S_{21} = \langle 16,5 \rangle + \langle 16,5 \rangle' + 2\langle 13,5,3 \rangle^* = k_2 = d_{33} + d_{34}$$

$$J_{21} \uparrow^{(3,11)} S_{21} = \langle 13,5,2 \rangle + \langle 13,5,2 \rangle' + \langle 12,5,2,1 \rangle^* \uparrow^{(3,11)} S_{21} = 2\langle 13,5,3 \rangle^* + \langle 12,5,3,1 \rangle + \langle 12,5,3,1 \rangle' = k_3 = d_{35} + d_{36}$$

$$J_{22} \uparrow^{(3,11)} S_{21} = \langle 12,5,2,1 \rangle^* + \langle 10,5,3,2 \rangle \uparrow^{(3,11)} S_{21} = \langle 12,5,3,1 \rangle + \langle 12,5,3,1 \rangle' + \langle 11,5,3,2 \rangle + \langle 11,5,3,2 \rangle' = k_4 = d_{37} + d_{38}$$

$$J_{23} \uparrow^{(3,11)} S_{21} = \langle 10,5,3,2 \rangle^* + \langle 9,5,4,2 \rangle^* \uparrow^{(3,11)} S_{21} = \langle 11,5,3,2 \rangle + \langle 11,5,3,2 \rangle' + \langle 9,5,4,3 \rangle + \langle 9,5,4,3 \rangle' = k_5 = d_{39} + d_{40}$$

$$J_{24} \uparrow^{(3,11)} S_{21} = \langle 9,5,4,2 \rangle^* + \langle 7,6,5,2 \rangle^* \uparrow^{(3,11)} S_{21} = \langle 9,5,4,3 \rangle + \langle 9,5,4,3 \rangle' + \langle 7,6,5,3 \rangle + \langle 7,6,5,3 \rangle' = k_6 = d_{41} + d_{42}$$

Since $\langle 18,3 \rangle \neq \langle 18,3 \rangle'$, $\langle 16,5 \rangle \neq \langle 16,5 \rangle'$, $\langle 12,5,3,1 \rangle \neq \langle 12,5,3,1 \rangle'$, $\langle 11,5,3,2 \rangle \neq \langle 11,5,3,2 \rangle'$,
 $\langle 9,5,4,3 \rangle \neq \langle 9,5,4,3 \rangle'$ and $\langle 7,6,5,3 \rangle \neq \langle 7,6,5,3 \rangle'$

On $(13, \alpha)$ regular classes then k_1, k_2, k_3, k_4, k_5 , and k_6 are splits (respectively) then we have the Brauer tree for B_4 and the decomposition matrix for this block $D_{21,13}^{(4)}$ in Table (4)

Lemma (3.5)

The Brauer tree for the block B_5 is:

$$\langle 18,2,1 \rangle^* - \langle 15,5,1 \rangle^* - \langle 14,5,2 \rangle^* - \langle 13,5,2,1 \rangle = \langle 13,5,2,1 \rangle' - \langle 10,5,3,2,1 \rangle^* - \langle 9,5,4,2,1 \rangle^* - \langle 7,6,5,2,1 \rangle^*$$

Proof:

$$\deg \{ \langle 18,2,1 \rangle^*, \langle 14,5,2 \rangle^*, \langle 10,5,3,2,1 \rangle^*, \langle 7,6,5,2,1 \rangle^* \} \equiv 2 \pmod{13}$$

$$\deg \{ \langle 15,5,1 \rangle^*, \langle 13,5,2,1 \rangle = \langle 13,5,2,1 \rangle', \langle 9,5,4,2,1 \rangle^* \} \equiv -2 \pmod{13}$$

Now, by using (r, \bar{r}) -inducing of p.i.s of S_{20} to S_{21} see table $D_{20,13}$ we have

$$J_{19} \uparrow^{(1,0)} S_{21} = \langle 18,2 \rangle^* + \langle 15,5 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 18,2,1 \rangle^* + \langle 15,5,1 \rangle^* = d_{43}$$

$$J_{20} \uparrow^{(1,0)} S_{21} = \langle 15,5 \rangle^* + \langle 13,5,2 \rangle + \langle 13,5,2 \rangle' \uparrow^{(1,0)} S_{21} = \langle 15,5,1 \rangle^* + 2\langle 14,5,2 \rangle^* + \langle 13,5,2,1 \rangle + \langle 13,5,2,1 \rangle' = k_1$$

$$J_{21} \uparrow^{(1,0)} S_{21} = \langle 13,5,2 \rangle + \langle 13,5,2 \rangle' + \langle 12,5,2,1 \rangle^* \uparrow^{(1,0)} S_{21} = 2\langle 14,5,2 \rangle^* + 2\langle 13,5,2,1 \rangle + 2\langle 13,5,2,1 \rangle' = 2k_2 = 2d_{45}$$

$$J_{22} \uparrow^{(1,0)} S_{21} = \langle 12,5,2,1 \rangle^* + \langle 10,5,3,2 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 13,5,2,1 \rangle + \langle 13,5,2,1 \rangle' + \langle 10,5,3,2,1 \rangle^* = d_{46}$$

$$J_{23} \uparrow^{(1,0)} S_{21} = \langle 10,5,3,2 \rangle^* + \langle 9,5,4,2 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 10,5,3,2,1 \rangle^* + \langle 9,5,4,2,1 \rangle^* = d_{47}$$

$$J_{24} \uparrow^{(1,0)} S_{21} = \langle 9,5,4,2 \rangle^* + \langle 7,6,5,2 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 9,5,4,2,1 \rangle^* + \langle 7,6,5,2,1 \rangle^* = d_{48}$$

Since $\langle 15,5,2 \rangle^* \downarrow^{(2,12)} S_{21} = \langle 15,5,1 \rangle^* + \langle 14,5,2 \rangle^*$ thus $k_1 - k_2 = \langle 15,5,1 \rangle^* + \langle 14,5,2 \rangle^* = d_{44}$ i.m. in S_{21} and $k_2 = d_{45}$ so we have the Brauer tree for B_5 and the decomposition matrix for this block $D_{21,13}^{(5)}$ in Table (5)

Lemma (3.6)

The Brauer tree for the block B_6 is:

$$\langle 17,3,1 \rangle^* - \langle 16,4,1 \rangle^* - \langle 14,4,3 \rangle^* - \langle 13,4,3,1 \rangle = \langle 13,4,3,1 \rangle' - \langle 11,4,3,2,1 \rangle^* - \langle 8,5,4,3,1 \rangle^* - \langle 7,6,4,3,1 \rangle^*$$

Proof :

$$\deg \{ \langle 17,3,1 \rangle^*, \langle 14,4,3 \rangle^*, \langle 11,4,3,2,1 \rangle^*, \langle 7,6,4,3,1 \rangle^* \} \equiv 8 \pmod{13}$$

$$\deg \{ \langle 16,4,1 \rangle^*, \langle 13,4,3,1 \rangle = \langle 13,4,3,1 \rangle', \langle 8,5,4,3,1 \rangle^* \} \equiv -8 \pmod{13}$$

Now, by using (r, \bar{r}) -inducing of p.i.s of S_{20} to S_{21} see (appendix I) $D_{20,3}$ we have

$$J_{25} \uparrow^{(1,0)} S_{21} = \langle 17,3 \rangle^* + \langle 16,4 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 17,3,1 \rangle^* + \langle 16,4,1 \rangle^* = d_{49}$$

$$J_{27} \uparrow^{(1,0)} S_{21} = \langle 13,4,3 \rangle + \langle 13,4,3 \rangle' + \langle 12,4,3,1 \rangle^* \uparrow^{(1,0)} S_{21} = 2\langle 14,4,3 \rangle^* + 2\langle 13,4,3,1 \rangle + 2\langle 13,4,3,1 \rangle' = 2d_{51}$$

$$J_{28} \uparrow^{(1,0)} S_{21} = \langle 12,4,3,1 \rangle^* + \langle 11,4,3,2 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 13,4,3,1 \rangle + \langle 13,4,3,1 \rangle' + \langle 11,4,3,2,1 \rangle^* = d_{52}$$

$$J_{29} \uparrow^{(1,0)} S_{21} = \langle 11,4,3,2 \rangle^* + \langle 8,5,4,3 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 11,4,3,2,1 \rangle^* + \langle 8,5,4,3,1 \rangle^* = d_{53}$$

$$J_{30} \uparrow^{(1,0)} S_{21} = \langle 8,5,4,3 \rangle^* + \langle 7,6,4,3 \rangle^* \uparrow^{(1,0)} S_{21} = \langle 8,5,4,3,1 \rangle^* + \langle 7,6,4,3,1 \rangle^* = d_{54}$$

Moreover, in [5] $J_3 = \langle 15,4,1 \rangle + \langle 14,4,2 \rangle$ p.i.s of S_{20} then

$$J_3 \uparrow^{(3,11)} S_{21} = \langle 15,4,1 \rangle + \langle 14,4,2 \rangle \uparrow^{(3,11)} S_{21} = \langle 16,4,1 \rangle^* + \langle 14,4,3 \rangle^* = d_{50}$$

So we have the Brauer tree for B_6 and the decomposition matrix for this block $D_{21,13}^{(6)}$ in Table (6)

شجرات براور للزمرة التناظرية S_{21} معيار $p=13$

عبدالكريم عبدالرحمن ياسين

قسم الرياضيات, كلية التربية والعلوم الاساسية, جامعة عجمان, الامارات العربية المتحدة

المستخلص

الهدف الرئيسي في هذا البحث هو ايجاد شجرات براور للزمرة التناظرية S_{21} معيار $p = 13$ والتي تعطي المشخصات الاسقاطية المعيارية ل S_{21} معيار $p = 13$
